eBook ISBN: 9780128223840

Imprint: Elsevier Inc.

Published Date: 22nd September 2020

Page Count: 790

To the best of my knowledge this is the first updated Textbook of Endocrinology of Elderly subjects.

Human Development undergoes biological changes throughout life, each period with its characteristics. Lately endocrinology of the transition/period between adolescence and adult age has received much attention, not so the transition from middle age to aging.

The text is written by internationally known experts in the field.

It is divided into 20 chapters starting with physiological and nutritional aspects of aging followed by specific endocrine diseases in old age.

Each chapter containing many didactic tables and figures in color of excellent reproduction and many references.

The description of the various endocrine disorders is followed by a discussion of the therapeutic approaches.

In the last century improved nutrition, the development of new diagnostic technologies, antibiotics and many drugs to treat endocrine and metabolic disorder have prolonged longevity.

This didactic text will help not only physicians' specialist in geriatric medicine, but also to endocrinologists, gynecologists and physicians in practice.
